Infected haematoma, Shin ulcer, Manuka honey dressings, Iodine dressings, Antibiotic resistance, Slow wound healing, Diabetes, Limb elevation, Fall injury.

Fainting, Shaking, Excessive thirst, Abdominal pain, Metronidazole, Probiotics, Pediatric evaluation, MRI brain, Intestinal worms, Antibiotic trial, Urine test.

hortness of breath, Left lower rib pain, Pleural pathology, Pulmonary embolism, Pneumonia history, Chest X-ray, CT chest, Pleural effusion, Atelectasis, Broad-spectrum antibiotic, Analgesic, Pulmonologist consultation.

Target Agent

Output: In the provided description, the doctor faces a complex decision: whether to prescribe antibiotics despite potential risks. Considering the context cases, particularly Case 3, we see a similar approach—empirical antibiotic therapy was advised pending imaging results, due to possible pleural infection or pneumonia. This sets a precedent: in the presence of symptoms suggesting possible bacterial involvement (e.g., chest pain, shortness of breath, history of pulmonary issues), the benefits of early antibiotic treatment may outweigh the risks, especially when immediate diagnostic clarity isn't achievable.

Here is the context: \n\n

1) Patient: Following a bad fall, I had an infected haematoma on my shin, which is now like an ulcer. Antibiotics have failed to stop infection recurring. Iodine and now manuka honey dressings have changed every other day. Fall was 6 weeks ago. I am a 54 year old female. Why might it be taking so long to heal? Doctor: HelloThanks for your thereafter going through your query I came to know that you got injury to your shin, and you got hematoma and now ulcer. Slow healing can be due to diabetes, so blood sugar should check. Elevation of limb is helpful. If you have any further questions then don't hesitate to writing to us. I will be happy to help you. You can also write to me directly on below link:<https://www.bit.ly/ask> Chat Doctor. Take care.

2) Patient: My daughter is 7 and was sent home from school today due to feeling faint, shaking and was drinking alot of water. She fainted at end of January 2011 and has been suffering tummy pains since xmas. Is there something underlying that is causing these symptoms? Urine test done and was clear in Jan 2011. Doctor: Hi. Thanks for your query and an elucidated history. It is imperative to undergo multiple tests in case of pain in abdomen of a child of 7 years as she may give a proper and detailed history. I would advise her the following::MRI of the brain as she had a history of fainting in January 2011. A therapeutic trial with a course of an antibiotic, metronidazole and probiotics under the guidance of a pediatrician / Surgeon always helps to solve the problem and to get a diagnosis. Also given is a dose of medicines active against worms in intestine.

3) Patient: I have had shortness of breathe and a sore area by my left lower rib for 6 months . I cannot lay on my left side because of the pain and shortness of breathe it causes. There are no pulmonary doctors in my area. I have a history of pneumonia and a blood clot in my left lung.\n Doctor: 1. Since there is pain on breathing thus it is a PLEURAL pathology and Chest X-ray and/or CT- Chest is must. 2. Have a consultation with a Pulmonologist first to exclude causes like: pleural effusion, pneumonia, pulmonary embolic, atelectasis or any other cause of pleural pain.3. Until then:. Use a broad spectrum antibiotic or combination covering both Gram +ve and Gram -ve organisms. Any analgesic which do not suppress respiration.\n\n\n
